

1. The world before, where Science and Technology is not a subject being focused on, though they had created/discovered things helpful to their everyday living, it's clear and undeniable that it was harder to live then. From pre-spanish to the commonwealth period, the philippines being occupied/handled by internationals, there are little to no Science and Technology development present. One reason why this happened is one to the takeover of japanese occupation, where the developments started in the commonwealth period are almost impossible to reach and though it is not stated as to why the developments are hard to reach, one thing's for sure: the Philippines is lacking and in need of help. But, when the independence had been reached, Science and Technology had became a focus, which ultimately lead to a better philippines. All in all, Science and Technology had helped the human history to achieve a better living, aas without the developments, the living history of humans are poorer and harder.
